

IMPLICIT VS EXPLICIT TYPE CASTING

Implicit Type Casting	Explicit Type Casting
<ul style="list-style-type: none">• This is automatic type conversion performed by JavaScript during code execution.• The conversion is handled by JavaScript, often without the developer's direct intention.• Often occurs in operations involving different data types, such as arithmetic operations or comparisons• Can lead to unexpected results or bugs if not carefully managed.	<ul style="list-style-type: none">• This is manual type conversion performed by the developer using built-in methods.• The developer explicitly specifies the type conversion.• Used when precise control over data types is needed, such as parsing user input.• Provides more predictable and controlled conversions, reducing the risk of errors
